

We call for governmental investigation into electronic harassment operations.

1 Use of non-lethal weapons against civilians

Do you know that numbers of civilians in the world are now saying they are being attacked by stealth weapons using invisible energy such as electromagnetic waves and sound waves?

For example, as you can use your cellular phone in your room, electromagnetic waves can go through walls. So, if you modify a microwave oven so that it emits microwave outside the box, you will be able to damage someone behind a wall. As one of the actual examples of an anti-personnel electromagnetic weapon, "Active Denial System" is relatively well known as such an anti-personnel electromagnetic weapon, which is used by military and police in the U.S. and other countries. The weapon utilizes high frequency mill waves to cause immediate thermal effects on human skin to cause pain and bring the target under control. Since this directed energy weapon is not designed to kill a person, it is categorized as a non-lethal weapon.

On the other hand, the system which emits electromagnetic waves and receives reflected frequencies to analyze them and measure the target is called "radar," and by using radar, you can identify the location and measure bio information of someone behind a wall. Does this mean you can be tracked, located and attacked by someone outside your room?

What would you do if you are attacked in such a way? If you rush to the place where you think the criminal is, you won't have any proof of the crime. However, you won't even know who is doing that nor will you understand what is happening to you because you have no idea such weapons exist at all. This is perfect crime. Therefore the criminal organization can attack you 24 hours, and it will not be long before your life and health are destroyed.

2 Bioeffects of electromagnetic wave and electronic harassment

An unclassified document by the U.S. army by FOIA in 2006, *Bioeffects of Selected Non-lethal Weapons*, describes various types of research on bio-effects of electromagnetic waves and their application to weapons, such as neutralizing a target by raising their temperature with microwaves, heating brain to disturb working memory and cause disorientation, stimulating a target's inner cochlear cell with pulse modulated microwaves to make the target hear fake sound and voices (microwave hearing effects), disturbing the control of neurons by radiation of pulse waves to cause epileptic symptom and other neurological disorders, and more other possibilities.

Those symptoms seen in research on non-lethal weapons are similar or related to symptoms of those who complain of being attacked by directed energy weapons. They have reported immediate rise in temperature, skin spasm, dizziness, tinnitus, hearing voices and the reception of other sensory information.

On the other hand, they have also reported such symptoms can be significantly mitigated by shielding, jamming and moving electronics in their houses unusually frequently have malfunction or breakdown, and visible surveillance and harassment by multiple such as noise and stalking, all of which show their experience are different from mental disorders. However, it is very difficult for them to prove the criminal actions by laws, and they have just endured one-sided attacks, and some of them commit suicide for the agony.

The media reportedly can be electromagnetic waves such as microwaves and lower frequencies or laser, interior wiring, sound waves, or other media. Such energy radiation on humans and electronics for attacking and surveillance purposes is called electronic harassment.

3 The hardship of victims around the world

Now, there are tens of thousands of people who have reported such intentional energy radiation in the world, and victim organizations have been formed as well.

There are three major difficulties which prevent the solution. First, it is technically almost impossible for ordinary citizens to measure harmful frequencies with devices for criminal accusation or proving criminal actions in court. Second, except for visible cuts allegedly made by laser, suffering in electronic harassment such as pains and delivered sensory information do not leave medical traces, which can be documented on medical certificate, making it difficult to prove the damage. Third, little of the information about this crime and related technology is around in society. So, authorities and public institutions such as police, doctors, media companies do not know such crime exist. Eventually the police never start investigation or require concrete and decisive physical proof of the crime before starting the investigation, which ordinary citizens cannot obtain.

Such predicaments have caused incidents by victims of this crime. In 2014 in Florida in the U.S, there was shooting at a university by a lawyer aged 31, and he was killed by the police. Prior to the incident, he videotaped himself saying he was a victim of electronic harassment and he would take an action to let people know about the crime. However, few of mass media reported the fact. In 2013 in another part in the U.S. a man broke in a military facility and killed 12 people with his gun and he was also killed. The man also contacted a victim organization of the crime and told that he was attacked by military with electromagnetic waves. However, the police took this case as in discriminant killing. The truce of those cases are unclear, what is clear is the whole society neglecting this crime and making it a taboo have caused such tragedies. Those kinds of sad incidents by the victims of this crime have occurred in many countries, and much more victims rather kill themselves.

Immediate Investigation!

We cannot neglect serious human right breach of one-sided torture of civilians and huge national security crisis. We call for immediate public investigation of electronic harassment.

Items to be included in the investigation

- electronic harassment and stealth weapons
- institutions involved in the crime
- non-consensual human experimentation
- non thermal bio-effects of EM waves
- measures to protect citizens
